Application, Characteristics, Technical Data

Application

Gas pressure regulator (GDR), indirect-acting (operating with auxiliary power), for systems acc. to DVGW - work sheet G 491 (A) and G 600 (A) (TRGI).

Can be used as an equipment component on gas consumption facilities as defined in EC Directive EU/2016/426 Can be used for the gases defined in DVGW work sheet G 260 / G 262 and neutral non-aggressive gases. (other gases on request)

Characteristics

- Regulator with double-diaphragm system
- Model according to DIN EN 334 / 14382
- Integral pressure-tight model (IS)
- Gas pressure regulator with or without integrated SSV
- Compact and maintenance-friendly modular design
- SSV functional class, optionally A $(p_{ds,u} + p_{ds,o})$ or B $(p_{ds,o})$
- Open-air model

Type of model / options (see pages 21-22)

- With fine filter FF upstream of the regulator
- With pneumatic follow-up setpoint from I/P converter
- With built-in noise reduction
- Optionally with AV breather valve
- With SSV manual release
- With electric position indicator SSV "Closed" via Reed contact
- With SSV electromagnetic remote release when power is applied or in case of power failure
- Oxygen model (p_{...} ≤ 10 bar)
- Hydrogen model
- Coating with epoxy resin in RAL colors

Function, strength, and tightness DIN EN 334 and DIN EN 14382

Ex protectionThe mechanical components of the device do not have any ignition sources of

their own and are thus not covered by the scope

of ATEX (2014/34/EU). Electrical components used at the device fulfil the ATEX

requirements.

Design and function of the gas pressure regulator (GPR)

The gas pressure regulator RSP 254/255 has the function of keeping the outlet pressure of a regulation section downstream of a gas pressure regulator constant within specified limits, independently of changes in the gas tap or inlet pressure. The required auxiliary energy is obtained from the pressure gradient between the inlet pressure and outlet pressure of the gas pressure regulator. No external energy is required.

The GPR consists of a regulator with regulating unit, optionally with connected upstream fine filter and bypass valve, and an actuator. The control variable - the outlet pressure - is detected by a sensitive diaphragm in the regulating unit, which is part of a double-diaphragm system. The pneumatic amplifier working by the nozzle/baffle plate principle is actuated by the comparator formed by a double-diaphragm system. The bypass valve and possible changes in the setpoint spring can be used to affect the static amplification of the regulator and adjust it to the respective condition of a regulation section.

The outlet pressure is applied to the top side of the double diaphragm system in the regulating unit via a measurement line and converted into a pressure force which is compared with the set setpoint spring force that is used as defined command variable for the outlet pressure to be regulated. Any deviation from the control value is followed by a suitable proportional change in the spacing between nozzle and baffle plate, corresponding to a proportional change in the setting pressure. The valve opening required in each case for adjusting the outlet pressure actual value to the setpoint is effected by the setting pressure generated by the actuating drive of the actuator.

In the operating state, the inlet pressure taken at the inlet flows as auxiliary energy through the nozzle/baffle plate system and the bypass valve into the outlet pressure chamber, generating, depending on the position of the nozzle/baffle plate system, the setting pressure for the valve opening position required in each case against the bypass valve. The auxiliary energy gas then flows back to the outlet pressure network via the bypass valve.

In case of zero tap of the regulation section, the amplifier valve in the double-diaphragm system of the regulating unit will close tight, causing the closing pressure to be established.

Models with pneumatic follow-up setpoint inputs with 1:1 and 1:2 pressure conversions are available. Using an IP converter allows you to continuously set directly the required outlet pressure setpoint via, for example, a 4 to 20 mA signal. Moreover, by means of a setting spring, variable zero points can be suppressed.

Design and function of the safety shut-off valve (SSV) direct-acting

In case of inadmissible overpressure or lack of gas in the regulation section, the actuator of the safety shut-off valve arranged in the same housing on the inlet side will shut off the gas flow.

To this end, the outlet pressure to be monitored is passed on to the SSV control device via a separate measurement line. As a function of the change in pressure, the SSV diaphragm in the control device is raised or lowered. When the outlet pressure in the regulation section exceeds or falls below a certain response pressure, the switch socket connected to the SSV diaphragm will move to the corresponding disengaging position, the balls of the engaging mechanism will release the SSV screw spindle, and the closing spring will press the SSV valve plate against the valve seat. The SSV actuator shuts off the gas flow gas-tight.

The SSV can only be opened by hand and engaged in the open position. To do so, the outlet pressure at the measuring point must be lowered below the upper response pressure or raised above the lower response pressure by at least the re-engaging differential amount (Δp).

The SSV can, except where otherwise stipulated in specific national legislation, be used in either functional class A (with diaphragm rupture protection) or B (without diaphragm rupture protection).

There is also the option of using a remote display for the SSV position "CLOSED" and a manual and remote release when power is applied or in case of power failure.

Preferred installation position

The gas pressure regulators RSP 254 / 255 shall be installed in the pipeline preferably in horizontal position. For all nominal widths, the direction of flow is indicated by an arrow on the housing.

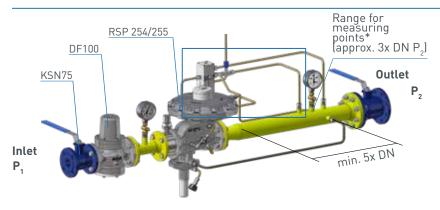

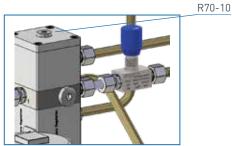

Only after consultation with Medenus GmbH

Note: Observe the following documents in relation to installation, start-up, and maintenance:

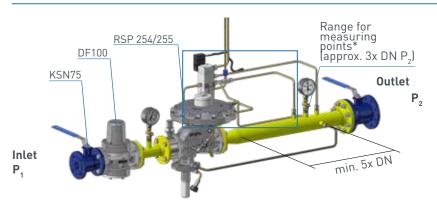

- DVGW work sheets G 491 and G 600
- Operating and Maintenance Instructions RSP 254 / 255

Determining the upper response pressure

Output pressure $P_{_d}$	Upper response pressure W _{dso} *
≤200 mbar	P_d +100 mbar
>200 mbar to <800 mbar	P _d x 1.5
>800 mbar to ≤1,600 mbar	$P_{d} \times 1.3$
>1,600 mbar	P_d +500 mbar
>3,000 mbar	P _d +1000 mbar

^{*)} Standard spring

simultaneously for the upper and lower set pressure (functional class A) the difference between the setpoints of the upper and lower response pressure (p_{dso} and p_{dsu}) and the outlet pressure pd must be at least "\Delta p_{wo} + 10%" or "\Delta p_{wu} + 10%". Otherwise it cannot be guaranteed that the control

device will re-engage.

R 70-10	Connection* for:
R 70-20 (1:2)	Tube 12 x 1.5
R 70-100	(thread G 1/4)

Note: Observe the following documents in relation to installation, start-up, and maintenance: DVGW - work sheets G 491 and G 600

Operating and Maintenance Instructions RSP 254 / 255

The gas pressure regulators RSP 254 / 255 shall be installed in the pipeline preferably in horizontal position. For all nominal widths, the direction of flow is indicated by an arrow on the housing.

^{*)} Threaded pipe connections to DIN EN ISO 8434-1 (DIN 2353)

Regulator R 70-10

Design of the gas pressure regulator RSP

Gas pressure regulator RSP 254 with integrated SSV direct-acting (optionally with pneumatic follow-up setpoint I/P converter)

Types of models / Options

Fine filter FF

Fine filters FF are intended to separate gas impurities such as dust, rust, and other solids in gas-carrying lines at a defined point. They are used in the inlet pressure line between the actuator RSP and the regulator R70. Fine filters FF can be used for gases according to DVGW worksheet G 260/G 262 and for neutral non-aggressive gases. (other gases on request)

Noise reduction

The noise reduction made of metallic foam reduces noise in the gas pressure regulator produced by the flow rate by up to -15 dB ($\pm 3 \text{ dB}$).

Noise reduction

AV breather valve

The AV breather valve is used to secure the installation room against inadmissible escape of gas from diaphragm comparator compartments of safety shut-off valves. In case of a defect, the impermissible escape of gas into the surrounding atmosphere is limited to a maximum of 30l/h (air).

It also serves as a substitute for an expensive and complex installation of breather lines.

(Option not available for hydrogen version H₂)

Reed contact

Reed contacts are used to monitor the position (closed or open position) of the safety shut-off valve via remote display.

SSV manual and remote release

The direct-acting safety solenoid valve is used as electromagnetic remote release for closing the safety shut-off valve when power is applied or in case of power failure.

Epoxy resin coating in RAL colors

To protect the gas pressure regulator from external influences, starting from a corrosivity category C5-M we recommend an epoxy resin coating.

Types of models

Oxygen version O_2 $(p_u \le 10 \text{ bar})$

Hydrogen version H₂ (with helium leak test)

The Medenus gas pressure regulators are suitable for use with hydrogen as a medium up to a proportion of 100%.

Further information can be found in the special edition (10/2019) of gwf Gas+Energie and on our homepage at (www.medenus.de)

Design

Calculation of the required K_e value

 $\begin{array}{c} p_{_d} \, / \, p_{_u} > 0.5 \\ \text{Valve flow rate coefficient } K_{_G} \text{ at} \\ \text{a subcritical pressure ratio} \\ K_{_G} = Q_{_n} \, / \sqrt{p_{_d} \cdot (p_{_u} - p_{_d})} \end{array}$

 $\begin{aligned} & p_{_{d}} \, / \, p_{_{u}} \! \leq 0.5 \\ \text{Valve flow rate coefficient } & K_{_{G}} \text{ at} \\ & \text{a supercritical pressure ratio} \\ & K_{_{G}} = 2 \bullet Q_{_{n}} \, / \, p_{_{u}} \end{aligned}$

Note: All calculated pressures are absolute pressures.

Device selection

The device is selected on the basis of its K_{G} value from the table of flow rate coefficients (page 10)

Note: For the device design, a capacity reserve of 10% is recommended.

Example:

 $1.5 \, \text{bar} / 6 \, \text{bar} = 0.25 < 0.5$

⇒ Supercritical pressure ratio $K_c = 2 \cdot 1500 / 6 = 500 [m^3/(h*bar)]$

AS 254 DN 50 VS 32,5 K₆ value: 750 m³/(h*bar)

Properties of Gases

- for natural gas ($\rho_0 = 0.83 \text{ kg/m}^3$; t = 15°C)
- Δp = pressure difference from inlet pressure to outlet pressure
- $Q_p = \text{max. possible volume flow (determined using } K_g \text{ values with a safety margin of 10%)}$
- f natural gas conversion factor- L

Gas	f	Hs,n	Gas	f	Hs,n
		[kWh/m³]			[kWh/m³]
Acetylene	0.84	16.25	Sewage gas	0.84

THE MEDENUS PLUS

10 reasons for good business relations

- 1. Extensive product portfolio: the choice is yours!
- 2. Customised solutions and special designs: talk to us!
- "DUSE" design programme: leave nothing to chance!
- 4. Shortest delivery times and spare parts: we won't leave you out in the rain!
- b. Certified according to ISO 9001, quality standard products: with us you can be sure!
- 6. Special tools? You can service our appliances without them!
- 7. Modular design of the devices: be flexible for the most diverse requirements!
- 8. 100% Made in Germany, 100% hydrogen-ready!
- 9. Online service 24/7: documents, maintenance videos, around the clock!
- 10. Expertise: benefit from our in-house trainings at your premises or trainings at our location!
